

Magic Cipher is the latest and greatest incarnation of the award winning R10Cipher. Magic Cipher is a simple to use, truly cross platform encryption solution for anyone who wishes to keep their their personal information private.

Magic Cipher will encrypt Text, Files and Folders making them unreadable to anyone not in possession of the Shared Secret that was used to perform the encryption.

Magic Cipher also makes it simple to hide information inside pictures and images, a technique known as Steganography.

Your encrypted text, files, folders or pictures can be stored anywhere a regular file would be stored, and can just as easily be emailed or shared.

*An encrypted file, folder or picture can be stored or sent in the full knowledge that it's contents are not visible to anyone without access to Magic Cipher and the Shared Secret.*

As Magic Cipher does not require installation you can, for example, copy the macOS, Windows and Linux versions of Magic Cipher to a USB drive along with your encrypted documents and files. Your documents and files are secure, but available whenever and wherever you require them. The built in Virtual Keyboard and Shared Secret Generator with Strength Meter help ensure your information stays as secure as possible.

*Magic Cipher does not make any alterations to your computer and stores it's configuration files within it's own folder.*

In this day and age it is more important than ever that we take our security and privacy seriously. It makes sense to encrypt. It makes even more sense to encrypt using Magic Cipher. [www.magiccipher.com](http://www.magiccipher.com)
