Detailed Overview

ScreenAudit is a Mac OSX application that performs snapshots of your **screen** , and if you wish - your **webcam** at timed intervals. If you have multiple monitors it will take snapshots of them all. The interval between snapshots, in seconds, the name of the destination folder (created within the ScreenAudit folder), and the quality of the resulting jpg can be set from within the Preferences menu. You can hide the Countdown and even get ScreenAudit to speak your own message as it takes the screenshot.

ScreenAudit is not designed for covert 'spying' on a computer. ScreenAudit has it's own window which shows a countdown until the next timed snapshot. The window flips from right to left as the snapshot is taken and the ScreenAudit icon in the dock displays the 'Note' graphic to let you know a snapshot has been taken. If you do not wish to view the ScreenAudit window it can of course be minimised. ScreenAudit will even snapshot the screen showing the Dashboard or Spaces overview if displayed.

In Use

ScreenAudit is useful for a number of purposes. Primarily it allows you to keep a record of your activities as you use your computer. If you bill for time then ScreenAudit can be used to remind you what you were doing and when.

If you install ScreenAudit on your child's computer they will be less likely to become exposed to the seedier side of the internet as they know you can **monitor what they are doing**. If you periodically check their screenshots you can be alerted to a potential problem before it occurs.

If you forget to save a document then ScreenAudit might come to your rescue by at least showing you the screen with the text displayed. You will have to type it again but at least you won't have to do it from memory.

If you are concerned that someone is using your computer in your absence then ScreenAudit will help you to see **what was done and who did it**. Yes they could quit ScreenAudit or even delete the snapshot files but then at least you would be aware that someone has perhaps been doing something they shouldn't !

If you manage a department you may wish to install ScreenAudit on your colleagues computers to keep a record of work done ?
